

# Things That Would Be Flagged About the Original File

purelane-homepage.html — Short Build Notes

---

## 1. Monolithic File Structure

Over 1,700 lines of HTML, embedded CSS, and script are bundled into a single static HTML file, with no sectioning. This makes it impossible to integrate directly with an e-commerce CMS like Shopify.

## 2. Scroll Logic Bug

The original scroll tracking relies on an `offsetTop / offsetParent` loop. This approach breaks on a real Shopify theme because of the nested `.shopify-section` wrappers, causing the progress rail to jump straight to the last dot instead of updating step by step.

## 3. Heavy Blur Filtering

The prototype applies `filter: blur(7px)` with 0.95s transitions on several card elements during scroll. This forces continuous GPU rasterization and leads to visible frame drops on mobile devices.

## 4. Fixed Offset Header & Ticker Conflict

The header offset is hardcoded to `top: 38px` for static markup. When ported into a dynamic Shopify theme header group, this causes layout conflicts between the ticker and the header elements.

## 5. Hardcoded E-commerce Data

Product titles, prices, compare-at prices, reviews, and trust badges are all hardcoded directly in the static HTML instead of being pulled dynamically from Shopify objects, making the content impossible for merchants to manage.
